METHODOLOGY FOR CONSIDERING STUDENTS' INDIVIDUAL EDUCATIONAL NEEDS THROUGH DIFFERENTIATED INSTRUCTION

University of Economics and Pedagogy, Karshi,
Gulhayo Roziqova
gulhayo4449090@gmail.com

Annotation. This article examines the pedagogical and methodological opportunities for taking students' individual educational needs into account through differentiated instruction. The essence and main principles of differentiated instruction are analyzed, along with ways of organizing the educational process according to students' levels of knowledge, abilities, interests, learning pace, and individual characteristics. The article also considers methods for diagnosing students, differentiating educational content and learning tasks, implementing an individualized approach, organizing group work, using tasks of different levels of difficulty, and assessing students' individual development dynamics. It is substantiated that differentiated instruction contributes to improving the effectiveness of the educational process, increasing students' learning motivation, and ensuring the active participation of each student by taking their individual abilities and educational needs into account.

Keywords: differentiated instruction, individual educational needs, individualized approach, instructional differentiation, learning motivation, individual development, teaching methodology, diagnostics, differentiated tasks, educational effectiveness, student abilities.

Аннотация. В статье рассматриваются педагогические и методические возможности учета индивидуальных образовательных потребностей учащихся на основе дифференцированного обучения. Анализируются сущность и основные принципы дифференцированного обучения, а также вопросы организации образовательного процесса с учетом уровня знаний, способностей, интересов, темпа усвоения учебного материала и индивидуальных особенностей учащихся.

Рассматриваются методика диагностики учащихся, дифференциация содержания образования и учебных заданий, реализация индивидуального подхода, организация групповой работы, использование заданий различного уровня сложности и оценивание динамики индивидуального развития учащихся. Обосновано, что дифференцированное обучение способствует повышению эффективности образовательного процесса, усилению учебной мотивации и обеспечению активного участия каждого учащегося в процессе обучения с учетом его индивидуальных возможностей.

Ключевые слова: дифференцированное обучение, индивидуальные образовательные потребности, индивидуальный подход, дифференциация обучения, учебная мотивация, индивидуальное развитие, методика обучения, диагностика, дифференцированные задания, эффективность образования, способности учащихся.

Annotatsiya. Mazkur maqolada differensial ta’lim asosida o‘quvchilarning individual ta’lim ehtiyojlarini hisobga olishning pedagogik va metodik imkoniyatlari yoritilgan. Differensial ta’limning mazmun-mohiyati, asosiy tamoyillari hamda o‘quvchilarning bilim darajasi, qobiliyati, qiziqishi, o‘zlashtirish sur’ati va individual xususiyatlariga mos ravishda ta’lim jarayonini tashkil etish masalalari tahlil qilingan. Shuningdek, o‘quvchilarni diagnostika qilish, ta’lim mazmuni va topshiriqlarini differensiallashtirish, individual yondashuvni amalga oshirish, guruhlar bilan ishlash, turli darajadagi topshiriqlardan foydalanish va o‘quvchilarning rivojlanish dinamikasini baholash metodikasi ko‘rib chiqilgan. Differensial ta’lim o‘quvchilarning imkoniyatlarini hisobga olgan holda ta’lim samaradorligini oshirish, o‘quv motivatsiyasini kuchaytirish va har bir o‘quvchining ta’lim jarayonidagi faolligini ta’minlashga xizmat qilishi asoslangan.

Kalit so‘zlar: differensial ta’lim, individual ta’lim ehtiyojlari, individual yondashuv, ta’limni differensiallashtirish, o‘quv motivatsiyasi, individual rivojlanish, ta’lim metodikasi, diagnostika, differensial topshiriqlar, ta’lim samaradorligi, o‘quvchi qobiliyati.

Today, one of the important tasks of the education system is to take into account students’ individual characteristics and create appropriate educational conditions

according to their abilities and needs. Not all students acquire knowledge at the same pace. Their levels of knowledge, interests, abilities, thinking styles, learning motivation, and learning speed differ from one another. Therefore, providing all students with the same content, tasks, and teaching methods does not always ensure effective learning outcomes.

One of the main objectives of modern education is to identify the potential of each student and create appropriate pedagogical conditions for their individual development. In this context, differentiated instruction plays an important role. Differentiated instruction involves organizing the educational process using different forms and methods according to students' levels of knowledge, abilities, interests, and individual educational needs. The main purpose of differentiation is not to separate students from one another, but to create favorable conditions for each student to learn according to their individual capabilities. In this process, more complex and creative tasks can be provided to advanced students, while students who require additional support can be given simpler, step-by-step, and clearly structured tasks.

Therefore, identifying and considering students' individual educational needs through differentiated instruction is one of the important factors in improving the quality and effectiveness of education. Differentiated instruction is a pedagogical approach based on adapting educational content, teaching methods, learning tasks, learning pace, and assessment methods according to students' individual differences. Its main purpose is not to force all students to achieve exactly the same results in the same way, but to create opportunities for each student to develop based on their existing abilities and potential.

Considering students' individual educational needs begins with studying and diagnosing their learning characteristics. The teacher should determine students' prior knowledge, the types of tasks they complete quickly or slowly, the mistakes they make, their interests in particular subjects or topics, and their level of independent learning. Diagnostic tests, observation, interviews, practical tasks, short assessments, and students' independent work can be used for this purpose. The results of the diagnostic process provide a clearer understanding of students' educational needs. For example, some students may understand a new topic quickly and work independently, while others may

require additional explanations, more examples, or practical exercises. Some students may perform better in theoretical tasks, whereas others may demonstrate stronger abilities in practical and creative activities. The next important stage is differentiating learning tasks. Differentiated tasks can be designed at different levels of difficulty within the same topic. Basic-level tasks may focus on understanding fundamental concepts, intermediate-level tasks may require students to apply knowledge in practice, while advanced tasks may focus on analysis, problem-solving, and creative thinking.

For example, in a mathematics lesson, students who are beginning to understand a topic may be given simple equation-solving exercises. Students who have mastered the topic can be given more complex problems or tasks that can be solved using several methods. Highly prepared students may be asked to solve real-life problem situations or independently create mathematical problems and determine their solutions. In differentiated instruction, it is important to vary not only the difficulty of tasks but also the level of support provided to students. Some students may need additional instructions, algorithms, examples, or guiding questions. Students with stronger independent learning skills can be given general directions and encouraged to find solutions on their own.

Group work is another effective method of organizing differentiated instruction. Students can be placed into small groups according to their level of knowledge, interests, or characteristics of task performance. However, it is not advisable to keep students in the same groups permanently. Group composition can be changed according to students' development and the objectives of specific learning activities.

During group activities, advanced students can not only complete more challenging tasks but also help their classmates, explain their ideas, and develop collaborative skills. Students who require additional support can benefit from group discussions and practical activities, which can help them understand the topic more effectively.

The role of the teacher is particularly important in differentiated instruction. The teacher does not simply provide the same requirements to all students but acts as a facilitator of individual development. The teacher observes students' abilities, adapts the

learning process, provides appropriate support when necessary, and gradually increases students' levels of independence.

When planning a lesson, the teacher should consider not only the question, "How will all students learn this topic?" but also, "What conditions should be created for students with different levels of preparation?" This requires careful and purposeful lesson planning.

Educational content can also be differentiated. The same topic can be explained through texts, examples, diagrams, tables, practical tasks, or problem-based situations of different levels of complexity. For example, a student who has difficulty understanding a complex scientific text may be provided with the main concepts in a simpler and shorter form. A student who has already mastered the topic may receive additional sources and analytical questions.

An important aspect of differentiated instruction is increasing students' learning motivation. When students receive tasks that correspond to their abilities, they are more likely to experience success. This increases their self-confidence and motivation to complete subsequent tasks. In contrast, if students are constantly given tasks that are significantly beyond their current abilities, they may experience repeated failure and gradually lose interest in learning.

It is also important to consider students' interests in differentiated instruction. Students can be given opportunities to choose different types of activities within the same educational topic. For example, in a literature lesson, one student may write an analytical essay about the characters of a literary work, another may create a creative response, while another may prepare a presentation or visual project based on the same work.

Digital technologies further expand the possibilities of differentiated instruction. Electronic learning platforms, interactive tasks, digital assessments, and educational applications can be used to provide individualized assignments, monitor learning outcomes, and recommend additional learning materials. Such tools provide teachers with additional information about students' learning progress and development.

Differentiated assessment is also an important component of this approach. Instead of evaluating all students only according to a single final result, it is appropriate to consider

their initial level and individual progress. For example, the positive development of a student who initially struggled with a topic but demonstrated significant improvement through consistent effort should also be recognized.

Assessment can take into account students' independence, quality of task performance, ability to identify and correct mistakes, and ability to apply knowledge in new situations. Self-assessment and peer assessment can also increase students' responsibility for their own learning process.

When implementing differentiated instruction, teachers should avoid permanently labeling students as "strong" or "weak." Students' abilities and levels of knowledge can change over time. A student who performs very well in one subject may require additional support in another subject or topic. Therefore, differentiation should be flexible and continuously adjusted according to students' development.

Another important aspect of differentiated instruction is inclusiveness. Creating appropriate conditions for students with different abilities and educational needs to learn together is consistent with the humanistic principles of education. The teacher should ensure that every student has an opportunity to demonstrate their abilities and actively participate in the educational process.

Overall, differentiated instruction not only considers students' current individual characteristics but also focuses on their potential for future development. It is important not only to provide tasks that correspond to students' current abilities but also to gradually introduce more complex tasks that expand their educational potential.

In conclusion, considering students' individual educational needs through differentiated instruction is one of the important conditions for improving the effectiveness of modern education. Taking into account each student's level of knowledge, abilities, interests, learning pace, and individual characteristics makes it possible to organize the educational process in a more effective, flexible, and learner-centered manner.

Differentiated instruction enables teachers to provide tasks appropriate to students' levels of knowledge, offer additional support when necessary, organize challenging and creative activities for advanced students, and continuously monitor each student's

individual progress. Such an approach increases students' self-confidence, strengthens learning motivation, and develops independent learning skills.

For differentiated instruction to be effective, teachers need to identify students' individual needs at the beginning of the learning process, adapt educational content and tasks, use various teaching methods and tools, and consider individual development when assessing learning outcomes. Teachers should continuously analyze students' performance and adjust their instructional strategies accordingly.

Thus, the systematic application of differentiated instruction contributes to ensuring the active participation of every student, realizing individual potential, and improving educational outcomes. Most importantly, differentiated instruction makes it possible to move away from a one-size-fits-all approach and create an educational environment that recognizes, supports, and develops the unique abilities and needs of every learner.
